

# Solaplex™ Pigments

## Exterior Masonry Paint Application

Colouration of exterior masonry paints is notoriously difficult. Exterior masonry paints are specially formulated to allow the underlying cement and concrete to breathe. Often, silicate paints are used for this application, but the alkaline nature of these paints restricts the colour palette to inorganic pigments only. In-plant tinting systems operate with a limited number of canisters, and pigments are carefully selected to provide extremes of colour.

- Solaplex™ Pigments offer more colour options to the formulator.
- Solaplex™ Pigments exhibit bright, clean colours and are compatible with all solvent and water-based paints, including silicate paints.
- Solaplex™ Pigments are very durable in exterior conditions, protecting the lifetime of the coating against UV and heat build-up.

Solaplex™ Pigments can be supplied as a powder, colour-matched powder blend or liquid dispersion
